Applicable rate	0.050085804				Powercor_RFM_inputs.xlsx, 'RFM input'!F281:F284 and F287; Distribution_handbook.pdf, p. 27, section 2.4.1, footnote 20.
Year-end factor	1.024736944				sqrt(1 + applicable rate). The factor grosses up actual net capex only; forecast is already at year end. Distribution_handbook.pdf, p. 27, section 2.4.1 and footnotes 19-20.

Calculation and scope

Actual net capex = gross capex - asset disposals - capital contributions. Year-end difference = actual net capex x year-end factor - 2020 forecast net capex. All capex figures are nominal AUD million.

Applicable rate = (1 + F287) / (1 + F284) x (1 + F282) - 1; year-end factor = sqrt(1 + applicable rate). Inputs are Powercor_RFM_inputs.xlsx, RFM input; policy is Distribution_handbook.pdf, p. 27, section 2.4.1 / footnotes 19-20.

All 12 named asset classes are included in the total, including Land. Land contributes -1.000822151768884; therefore the total is not just network plus non-network. Results displays 0.000 while underlying full-precision values are retained.

The Results interface contains exactly the four requested columns and the three requested labels in order. Each result retains a source reference. Supporting worksheets may be organized freely; static values and cached formulas are both permitted by the task.
